Poster Presentation P4

**THE *bchC* GENE IN BACTERIOCHLOROPHYLL  
BIOSYNTHESIS IN RHODOBACTER CAPSULATUS**

Marybeth Bartelt and David Bollivar\*

Department of Biology, Illinois Wesleyan University

This project was designed to test the hypothesis that the *bchC* gene of *R. capsulatus* contributes to bacteriochlorophyll biosynthesis and encodes the 2-hydroxyethyl bacteriochlorophyllide dehydrogenase. The gene was cloned and inserted into *E. coli*, and overexpression of the BchC protein was induced. A mutant strain that accumulates 2-hydroxyethyl bacteriochlorophyllide *a*, an intermediate in bacteriochlorophyll synthesis, provided a substrate for BchC assays. Activity of the BchC protein was indicated by presence of bacteriochlorophyllide *a*, as detected by fluorescence analysis. It was demonstrated that the BchC enzyme requires NADPH to perform its catalytic role.
